

Measuring for and fitting a noticeboard.

Options

Our magnetic noticeboard are designed to be adhered to the directly to the wall for a neat seamless appearance with no visible fixings. If you prefer we can add mounting holes and include stainless steel domehead screws for a small additional charge to complete the look. There are two options available for our noticeboards, thickness and direction of the brushing. Both of these are purely aesthetic choices and will not affect the functionality of the noticeboard in any way.

Measuring

The only thing you should consider when measuring for a noticeboard is whether any dimensions are enclosed. For example, a single noticeboard that simply fits onto an open wall can be simply ordered at the required size as there will be nothing butting up to it that needs taking into consideration. When the noticeboard is enclosed on one or more sides, we would recommend measuring the exact gap and allowing 1mm per enclosed side. This size gap can easily be sealed neatly using our CT1 sealant.

Fitting

To fit, simply adhere to the wall, either using a silicon adhesive or a grip-type adhesive like No-nails, available through most DIY stores. Run several generous lines along the reverse of the noticeboard and apply to the wall. If the noticeboard does require any sealing around the edges, we recommend using our high quality CT1 sealant. This needs to be applied sparingly to the join and any excess cleaned off the surface of the noticeboard immediately using white spirit and a soft cloth.
